

# Solutions to exercises from Lecture 0

**0.12** Here are three possibilities:

- a. Take sets  $X_1$  and  $X_2$ , their disjoint union  $X_1 \amalg X_2$ , and the inclusions

$$X_1 \xrightarrow{\text{in}_1} X_1 \amalg X_2 \xleftarrow{\text{in}_2} X_2.$$

Then the following universal property holds:

(Compare Example 0.5.)

- b. Take a group  $G$ , its abelianization  $G^{\text{ab}} = G/[G, G]$ , and the natural map  $q : G \rightarrow G^{\text{ab}}$ . Then  $G \xrightarrow{q} G^{\text{ab}}$  is the universal homomorphism from  $G$  to an abelian group. That is, if  $G \xrightarrow{f} A$  is a homomorphism from  $G$  to an abelian group  $A$ , there is a unique homomorphism  $\bar{f} : G^{\text{ab}} \rightarrow A$  such that  $\bar{f} \circ q = f$ :

(Compare Example 0.1.)

- c. Take sets  $A$  and  $B$ , the set  $B^A$  of functions from  $A$  to  $B$ , and the evaluation map

$$\begin{aligned} \varepsilon : B^A \times A &\longrightarrow B \\ (f, a) &\longmapsto f(a). \end{aligned}$$

For any set  $Z$  and function  $\theta : Z \times A \rightarrow B$ , there is a unique function  $\bar{\theta} : Z \rightarrow B^A$  such that

commutes. (This  $\bar{\theta}$  is given by  $(\bar{\theta}(z))(a) = \theta(z, a)$ .)

**0.13** I'll do (a). Fix sets  $X_1$  and  $X_2$ . Suppose that

$$X_1 \xrightarrow{i_1} Y \xleftarrow{i_2} X_2$$

has the universal property

$$\begin{array}{ccc}
 & W & \\
 f_1 \nearrow & \vdots & \nwarrow f_2 \\
 & \exists! f & \\
 & \vdots & \\
 & Y & \\
 i_1 \nearrow & & \nwarrow i_2 \\
 X_1 & & X_2
 \end{array} \tag{1}$$

and that

$$X_1 \xrightarrow{i'_1} Y' \xleftarrow{i'_2} X_2$$

does too. Take  $(W, f_1, f_2) = (Y', i'_1, i'_2)$  in (1): then we obtain  $f : Y \longrightarrow Y'$  such that  $f i_1 = i'_1$  and  $f i_2 = i'_2$ . Similarly, we obtain  $f' : Y' \longrightarrow Y$  such that  $f' i'_1 = i_1$  and  $f' i'_2 = i_2$ . But then  $(f' f) i_1 = 1_Y i_1$  and  $(f' f) i_2 = 1_Y i_2$ ; in other words, the following diagram commutes when the dotted arrow is either  $f' f$  or  $1_Y$ :

$$\begin{array}{ccc}
 & Y & \\
 i_1 \nearrow & \vdots & \nwarrow i_2 \\
 & f' f & \\
 & \vdots & \\
 & Y & \\
 i_1 \nearrow & & \nwarrow i_2 \\
 X_1 & & X_2
 \end{array}$$

So by the uniqueness part of the universal property,  $f' f = 1_Y$ . Similarly,  $f f' = 1_{Y'}$ . So  $Y \cong Y'$ .
