

# A Second Order Algebraic Knot Concordance Group

Mark Powell, Indiana University

6th December 2011

# Setting the Scene

There is a surjection:

$$\mathcal{C} := \text{Concordance of } K: S^1 \subset S^3 \twoheadrightarrow$$

$$\text{Concordance of } K: S^{4k+1} \subset S^{4k+3}, (k \geq 1) \cong \mathcal{L}_k$$

High dimensional knots are determined by algebra,

$$\mathcal{L} = \mathcal{L}_k \cong \mathcal{L}_{k+4}.$$

In low dimensions this is not the case: the map  $\mathcal{C} \rightarrow \mathcal{L}$  has an interesting kernel.

High dimensional obstructions are then just the 1st order obstructions, out of an infinite sequence.

This talk is about 2nd order obstructions, which I try to understand using chain complexes and algebraic surgery theory.

# Slice Knots

A Second Order  
Algebraic Knot  
Concordance  
Group

Mark Powell,  
Indiana University

## Definition

An oriented knot  $K: S^1 \subset S^3$  is a *slice knot* if there is an embedded disk  $D^2 \subset D^4$ ,  $\partial D^4 = S^3$ , with  $\partial D^2 = K$  (Fox-Milnor 1959). This is called a slice disc.

$$\begin{array}{ccc} S^1 & \hookrightarrow & S^3 \\ \downarrow & & \downarrow \\ D^2 & \hookrightarrow & D^4 \end{array}$$

All embeddings must be locally flat.

# Seifert Form

A Second Order  
Algebraic Knot  
Concordance  
Group

Mark Powell,  
Indiana University

## Definition

The Seifert form with respect to a Seifert Surface  $F$  is a pairing on  $H_1(F; \mathbb{Z}) \cong \mathbb{Z}^{2g}$ :

$$V: H_1(F; \mathbb{Z}) \times H_1(F; \mathbb{Z}) \rightarrow \mathbb{Z}$$

which is defined by:

$$(x, y) \mapsto \text{lk}(x^+, y)$$

where  $\text{lk}$  is the linking number in  $S^3$  and  $x^+$  is the push off of  $x$  along a positive normal direction to  $F$ .

# Seifert Form - Example

With respect to the basis of curves shown the Seifert Form is given by:

$$V = \begin{pmatrix} n & 1 \\ 0 & -1 \end{pmatrix}$$

Figure: The  $n$ th twist knot

# 1st Order Algebraic Concordance

A Second Order  
Algebraic Knot  
Concordance  
Group

Mark Powell,  
Indiana University

A knot is said to be *Algebraically Slice* if there is a basis for the 1st homology of a Seifert Surface such that the Seifert Form is:

$$\begin{pmatrix} 0 & A \\ B & C \end{pmatrix}$$

with block matrices  $A, B, C$  such that  $C = C^T$  and  $A - B^T$  is invertible.

We can add Seifert Forms over  $\mathbb{Z}$  by  $\oplus$ .

Setting Seifert forms as above to be zero gives us a group  $\mathcal{L}$ , since there is a change of basis so that  $A \oplus -A$  has the form above.

$\mathcal{L} :=$  the Witt group of Seifert forms.

Knot Concordance

The 1st Order  
Algebraic  
Concordance  
Group  $\mathcal{L}$

Cochran-Orr-  
Teichner  
Obstructions

A 2nd Order  
Algebraic  
Concordance  
Group

An Extension

## Proposition

*A slice knot  $K$  is algebraically slice.*

Proof: Push a Seifert surface  $F$  into  $D^4$ , and let  $D$  be a slice disk for  $K$ .  $F \cup_K D = \partial M^3$  for some  $M^3 \subset D^4 \setminus (F \cup_K D)$ .

Then

$$\ker(H_1(F \cup_K D) \rightarrow H_1(M))$$

gives a zero-linking half rank summand so the matrix looks like:

$$\begin{pmatrix} 0 & A \\ B & C \end{pmatrix}$$

as required.

## Corollary

*There is a surjective homomorphism:*

$$\text{Seifert: } \mathcal{C} \twoheadrightarrow \mathcal{L}.$$

Cochran-Orr-  
Teichner  
Obstructions

A 2nd Order  
Algebraic  
Concordance  
Group

An Extension

Pretend to forget about topology: we define a group of purely algebraic objects.

First, we define a monoid of chain complexes, and then take a quotient by an algebraic concordance relation.

# A Monoid of Chain Complexes

Elements are chain equivalence classes of triples  $(H, C, \xi)$ , where  $H$  is a  $\mathbb{Z}[\mathbb{Z}]$ -module,  $C$  is a 3-dimensional symmetric Poincaré triad:

$$\begin{array}{ccc} C_*(S^1 \times S^0; \mathbb{Z}[\mathbb{Z} \ltimes H]) & \xrightarrow{i_-} & C_*(S^1 \times D_-^1; \mathbb{Z}[\mathbb{Z} \ltimes H]) \\ \downarrow i_+ & & \downarrow f_- \\ C_*(S^1 \times D_+^1; \mathbb{Z}[\mathbb{Z} \ltimes H]) & \xrightarrow{f_+} & Y. \end{array}$$

such that

$$\text{Id} \otimes f_{\pm} : C_*(S^1 \times D^1; \mathbb{Z}) \rightarrow \mathbb{Z} \otimes_{\mathbb{Z}[\mathbb{Z} \ltimes H]} Y$$

are isomorphisms of  $\mathbb{Z}$ -homology,  
and

$$\xi : H \cong H_1(\mathbb{Z}[\mathbb{Z}] \otimes_{\mathbb{Z}[\mathbb{Z} \ltimes H]} Y)$$

is an isomorphism.

# A Monoid of Chain Complexes

Given a knot  $K$ , with

$$X := S^3 \setminus \nu K,$$

define an element of our monoid by taking:

$$H := \frac{\pi_1(X)^{(1)}}{\pi_1(X)^{(2)}}$$

and

$$Y := C_*(X; \pi_1(X)/\pi_1(X)^{(2)}),$$

noting that:

$$\pi_1(X)/\pi_1(X)^{(2)} \cong \frac{\pi_1(X)}{\pi_1(X)^{(1)}} \rtimes \frac{\pi_1(X)^{(1)}}{\pi_1(X)^{(2)}} \cong \mathbb{Z} \rtimes H_1(X; \mathbb{Z}[\mathbb{Z}]).$$

# Symmetric Structure

The Symmetric Structure is the chain level version of Poincaré duality; each chain complex  $C$  carries the extra structure of a chain map from  $C^* \rightarrow C_*$ :

$$\begin{array}{ccccccc} C^0 & \xrightarrow{\delta_1} & C^1 & \xrightarrow{\delta_2} & C^2 & \xrightarrow{\delta_3} & C^3 \\ \downarrow \varphi_0 & & \downarrow \varphi_0 & & \downarrow \varphi_0 & & \downarrow \varphi_0 \\ C_3 & \xrightarrow{\partial_3} & C_2 & \xrightarrow{\partial_2} & C_1 & \xrightarrow{\partial_1} & C_0 \end{array}$$

Chain level maps which induce the Poincaré duality isomorphisms.

# The Symmetric Structure

A Second Order  
Algebraic Knot

Knot Concordance

The 1st Order  
Algebraic  
Concordance  
Group  $\mathcal{L}$

Cochran-Orr-  
Teichner  
Obstructions

A 2nd Order  
Algebraic  
Concordance  
Group

An Extension

Definition of cap product: the symmetric structure arises as the image of a fundamental class  $[X, \partial X]$  under a chain level diagonal approximation map:

$$\begin{aligned}\Delta_0: C_*(X) &\rightarrow C_*(\tilde{X}) \otimes_{\mathbb{Z}[\pi_1(X)]} C_*(\tilde{X}) \\ &\cong \text{Hom}_{\mathbb{Z}[\pi_1(X)]}(C^{3-*}(\tilde{X}), C_*(\tilde{X})).\end{aligned}$$

# Adding Knots Algebraically

Tensor both triads with  $\mathbb{Z}[\mathbb{Z} \ltimes (H \oplus H^\dagger)] = \mathbb{Z}[\mathbb{Z} \ltimes H^\dagger]$  so all chain complexes are over the same ring.

$$\begin{array}{ccccc} C(S^1 \times D_-^1) & \xleftarrow{i_-} & C(S^0 \times S^1) & \xrightarrow{i_+^\dagger} & C(S^1 \times D_+^1)^\dagger \\ \downarrow f_- & & \downarrow i_+ & & \downarrow f_+^\dagger \\ Y & \xleftarrow{f_+} & C(S^1 \times D_+^1) & \xrightarrow{f_-^\dagger} & Y^\dagger \end{array}$$

Glue by forming the mapping cone  $\mathcal{C}(-f_+, f_-^\dagger)$ .

# Algebraic Concordance

An object is 2nd order algebraically null-concordant if there exists a  $\mathbb{Z}[\mathbb{Z}]$ -module  $H'$  with a homomorphism  $H \rightarrow H'$  and a 4-dimensional chain complex  $V$  over  $\mathbb{Z}[\mathbb{Z} \times H']$  which fits into a 4-dimensional symmetric Poincaré triad:

$$\begin{array}{ccc} C(S^1 \times S^1; \mathbb{Z}[\mathbb{Z} \times H']) & \xrightarrow{f^U} & \mathbb{Z}[\mathbb{Z} \times H'] \otimes Y^U \\ \downarrow f & & \downarrow j^U \\ \mathbb{Z}[\mathbb{Z} \times H'] \otimes Y & \xrightarrow{j} & V \end{array}$$

# Algebraic Concordance

An object is 2nd order algebraically null-concordant if there exists a  $\mathbb{Z}[\mathbb{Z}]$ -module  $H'$  with a homomorphism  $H \rightarrow H'$  and a 4-dimensional chain complex  $V$  over  $\mathbb{Z}[\mathbb{Z} \times H']$  which fits into a 4-dimensional symmetric Poincaré triad:

$$\begin{array}{ccc} C(S^1 \times S^1; \mathbb{Z}[\mathbb{Z} \times H']) & \xrightarrow{f^U} & \mathbb{Z}[\mathbb{Z} \times H'] \otimes Y^U \\ \downarrow f & & \downarrow j^U \\ \mathbb{Z}[\mathbb{Z} \times H'] \otimes Y & \xrightarrow{j} & V \end{array}$$

where  $Y^U$  corresponds to the unknot, satisfying:

1.  $H_*(V; \mathbb{Z}) \cong H_*(S^1; \mathbb{Z})$ ; and
2. There exists an isomorphism  $\xi': H' \cong H_1(V; \mathbb{Z}[\mathbb{Z}])$ .

# Algebraic Concordance

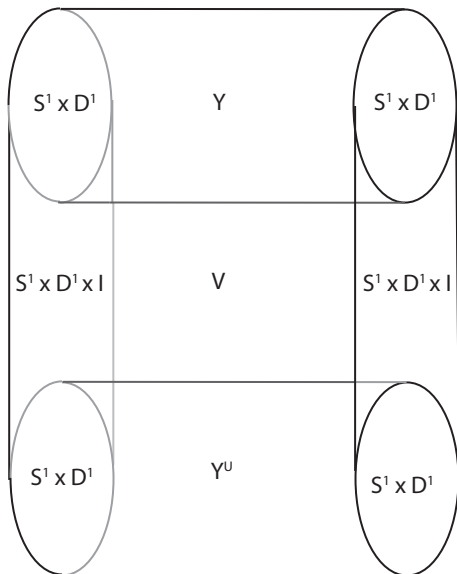

with a commutative diagram:

$$\begin{array}{ccc} H & \xrightarrow{\quad} & H' \\ \cong \downarrow \xi & & \cong \downarrow \xi' \\ H_1(\mathbb{Z}[\mathbb{Z}] \otimes Y) & \xrightarrow{j_*} & H_1(\mathbb{Z}[\mathbb{Z}] \otimes V). \end{array}$$

The duality information of the symmetric structure then limits the possible  $H'$  which can occur.

# Algebraic Concordance

Think of  $V$  as  $S^3 \times I$  minus a concordance  $S^1 \times I$ .

An Extension

Our *2nd order algebraic concordance group*  $\mathcal{AC}_2$  is symmetric Poincaré triads modulo 2nd order algebraic concordance.

Concordance of knots modulo  $\mathcal{F}_{(1.5)}$  is measured by  $\mathbb{Z}$ -homology cobordism of chain complexes.

## Proposition

A (1.5)-solvable knot is 2nd order algebraically concordant to the unknot.

Idea of proof:

The algebraic conditions on the intersection form of a (1.5)-solution 4-manifold  $W$ , with  $\mathbb{Z}[\pi_1(W)/\pi_1(W)^{(2)}]$  coefficients, are that we have a basis of  $H_2(W; \mathbb{Z})$  which lifts to a Lagrangian over

$$\mathbb{Z}[\pi_1(W)/\pi_1(W)^{(2)}] \cong \mathbb{Z}[\mathbb{Z} \ltimes H']$$

with a dual Lagrangian over

$$\mathbb{Z}[\pi_1(W)/\pi_1(W)^{(1)}] \cong \mathbb{Z}[\mathbb{Z}].$$

# Relation to Cochran-Orr-Teichner

## Proposition

A (1.5)-solvable knot is 2nd order algebraically concordant to the unknot.

Idea of proof:

The algebraic conditions on the intersection form of a (1.5)-solution 4-manifold  $W$ , with  $\mathbb{Z}[\pi_1(W)/\pi_1(W)^{(2)}]$  coefficients, are that we have a basis of  $H_2(W; \mathbb{Z})$  which lifts to a Lagrangian over

$$\mathbb{Z}[\pi_1(W)/\pi_1(W)^{(2)}] \cong \mathbb{Z}[\mathbb{Z} \ltimes H']$$

with a dual Lagrangian over

$$\mathbb{Z}[\pi_1(W)/\pi_1(W)^{(1)}] \cong \mathbb{Z}[\mathbb{Z}].$$

$H_2(W; \mathbb{Z})$  looks spherical *algebraically*, so make  $V$  using algebraic surgery on the chain complex of  $W$ .

An Extension

## Proposition

*There is a surjective homomorphism  $\mathcal{AC}_2 \twoheadrightarrow \mathcal{L}$ .*

Idea of Proof:

Use representation  $\mathbb{Z} \ltimes H \rightarrow \mathbb{Z}$ : Chain complex over  $\mathbb{Z}[\mathbb{Z}]$  with symmetric structure contains sufficient data to extract the Seifert Form.

# Relation to Cochran-Orr-Teichner

## Proposition

Let  $\mathcal{Y} = 0 \in \mathcal{AC}_2$ , and let  $\Gamma = \mathbb{Z} \rtimes \mathbb{Q}(t)/\mathbb{Q}[t, t^{-1}]$  be the Cochran-Orr-Teichner (1)-solvable group.

Then there exists a set of zero linking curves  $P \subset H_1(F; \mathbb{Z})$  such that whenever we define a representation

$\phi_p: \mathbb{Z} \rtimes H \rightarrow \Gamma$  using  $p \in P$ , the  $\rho$ -invariant (which can be defined algebraically)

$$\rho(\mathcal{Y}, \phi_p) = 0.$$

# Relation to Cochran-Orr-Teichner

## Proposition

Let  $\mathcal{Y} = 0 \in \mathcal{AC}_2$ , and let  $\Gamma = \mathbb{Z} \times \mathbb{Q}(t)/\mathbb{Q}[t, t^{-1}]$  be the Cochran-Orr-Teichner (1)-solvable group.

Then there exists a set of zero linking curves  $P \subset H_1(F; \mathbb{Z})$  such that whenever we define a representation  $\phi_p: \mathbb{Z} \times H \rightarrow \Gamma$  using  $p \in P$ , the  $\rho$ -invariant (which can be defined algebraically)

$$\rho(\mathcal{Y}, \phi_p) = 0.$$

Idea of Proof:

Representation defined using  $p \in P$  implies it extends over  $\mathbb{Z} \times H'$ , so over the 4-dimensional complex  $V$ .

$$H_2(V; \mathbb{Z}) \cong 0,$$

so there is no intersection form, therefore  $L^{(2)}$  and ordinary signatures vanish.

## Example

Original Casson-Gordon example, can follow Cochran-Orr-Teichner proof of non-sliceness in the chain complex setting:

For example,  $\mathcal{Y} =$  the symmetric Poincaré triad associated to the  $k$ -twist knot,  $k \neq 0, 2$ ,

Then  $\mathcal{Y} \neq 0 \in \mathcal{AC}_2$ .

## Example

Original Casson-Gordon example, can follow Cochran-Orr-Teichner proof of non-sliceness in the chain complex setting:

For example,  $\mathcal{Y}$  = the symmetric Poincaré triad associated to the  $k$ -twist knot,  $k \neq 0, 2$ ,

Then  $\mathcal{Y} \neq 0 \in \mathcal{AC}_2$ . Let  $p$  be zero linking curve on Seifert surface: a knot  $J$ .

$$\rho(\mathcal{Y}, \phi_p) = \rho(M_J, \psi: \pi_1(M_K) \rightarrow \mathbb{Z}).$$

For twist knots,  $J$  is a torus knot, and these have non-zero  $L^{(2)}$ -signatures:

$$\rho(M_J, \psi) = \int_{\omega \in S^1} \sigma_\omega.$$

An Extension

Objects as symmetric Poincaré chain complexes  $C_*$  over  $\mathbb{Z}[\pi]$ ,  $\pi$  finitely presented group.

Extra structure: isomorphisms

$$\xi_H: H_{ab} \xrightarrow{\cong} H_1(C_* \otimes_{\mathbb{Z}[\pi]} \mathbb{Z}[\pi/H])$$

for all  $H \leq \pi$ . A chain complex need not admit such isomorphisms in general.

# Extension

$(\pi, C_*, \xi)$  is null cobordant if there exists  $(\Gamma, D_*, \zeta)$ ,  $\Gamma$  a finitely presented group,  $D_*$  a chain complex over  $\mathbb{Z}[\Gamma]$ ,

$$\zeta_K: K_{ab} \xrightarrow{\cong} H_1(D_* \otimes_{\mathbb{Z}[\Gamma]} \mathbb{Z}[\Gamma/K])$$

for all  $K \leq \Gamma$ , with a homomorphism

$$\omega: \pi \rightarrow \Gamma$$

a symmetric Poincaré pair

$$j_*: C_* \otimes_{\mathbb{Z}[\pi]} \mathbb{Z}[\Gamma] \rightarrow D_*$$

# Extension

and a commutative square:

$$\begin{array}{ccc} \bigoplus_{\text{im } \omega \setminus \Gamma/H} (\ker(\omega) \cap \phi^{-1}(H))_{ab} & \longrightarrow & H_{ab} \\ \downarrow & & \downarrow \\ \bigoplus_{\text{im } \omega \setminus \Gamma/H} H_1(C_* \otimes \mathbb{Z}[\frac{\pi}{\ker(\omega) \cap \phi^{-1}(H)}])) & \longrightarrow & H_1(D_* \otimes \mathbb{Z}[\Gamma/H]) \end{array}$$

for all subgroups  $H \leq \Gamma$ .

# Extension

and a commutative square:

$$\begin{array}{ccc} \bigoplus_{\text{im } \omega \setminus \Gamma/H} (\ker(\omega) \cap \phi^{-1}(H))_{ab} & \longrightarrow & H_{ab} \\ \downarrow & & \downarrow \\ \bigoplus_{\text{im } \omega \setminus \Gamma/H} H_1(C_* \otimes \mathbb{Z}[\frac{\pi}{\ker(\omega) \cap \phi^{-1}(H)}])) & \longrightarrow & H_1(D_* \otimes \mathbb{Z}[\Gamma/H]) \end{array}$$

for all subgroups  $H \leq \Gamma$ .

We call  $\xi, \zeta$  *Hurewicz structures*. They combine with duality structures to severely limit the possible  $\Gamma$  which can occur.

We can define corresponding surgery groups  $L_H^n(G)$ , which coincide with the usual  $L$ -groups in high dimensions but which have much more information in low dimensions.
